

Swift Cheat Sheet and Quick Reference

Class Implementation

```
class MyClass : OptionalSuperClass,
OptionalProtocol1, OptionalProtocol2 {
  var myProperty:String
  var myOptionalProperty:String?
  // More properties...
  init() {
    myProperty = "Foo"
  }
  // More methods...
}
```

Methods

```
func doIt() -> Int {
  return 0
}
func doIt(a:Int) -> Int {
  return a
}
func doIt(a:Int, b:Int) -> Int {
  return a+b
}
```

Creating/Using an Instance

```
var a = MyClass()
a.myProperty
a.doIt()
a.doIt(1)
a.doIt(2, b:3)

Enums

enum CollisionType: Int {
   case Player = 1
   case Enemy = 2
}
var type = CollisionType.Player
```

Declaring Variables

```
var mutableDouble:Double = 1.0
mutableDouble = 2.0

let constantDouble:Double = 1.0
// constantDouble = 2.0 // error

var mutableInferredDouble = 1.0

var optionalDouble:Double? = nil
optionalDouble = 1.0
if let definiteDouble = optionalDouble {
    definiteDouble
}
```

Variable types	
Int	1, 2, 500, 10000
Float	1.5, 3.14, 578.234
Double	
Bool	true, false
String	"Kermit", "Gonzo", "Ms.
	Piggy"
ClassName	UIView, UIButton, etc

Control Flow

```
var condition = true
if condition {
} else {
}

var val = 5
switch val {
case 1:
    "foo"
case 2:
    "bar"
default:
    "baz"
}

// omits upper value, use ... to include
for i in 0..3 {
```

String Quick Examples

```
var personOne = "Ray"
var personTwo = "Brian"
var combinedString = "\(personOne):
Hello, \(personTwo)!"
var tipString = "2499"
var tipInt = tipString.toInt()

extension Double {
   init (string: String) {
      self =
   Double(string.bridgeToObjectiveC().doubleValue)
   }
}
tipString = "24.99"
var tip = Double(string:tipString)
```

Array Quick Examples

```
var person1 = "Ray"
var person2 = "Brian"
var array:String[] = [person1, person2]
array += "Waldo"
for person in array {
   println("person: \((person)"))
}
var waldo = array[2]
```

Dictionary Quick Examples

```
var dict:Dictionary<String, String> =
["Frog": "Kermit", "Pig": "Ms. Piggy",
"Weirdo": "Gonzo" ]
dict["Weirdo"] = "Felipe"
dict["Frog"] = nil // delete frog
for (type, muppet) in dict {
  println("type: \(type), muppet:
  \(muppet)")
}
```
